CPT205 Computer Graphics
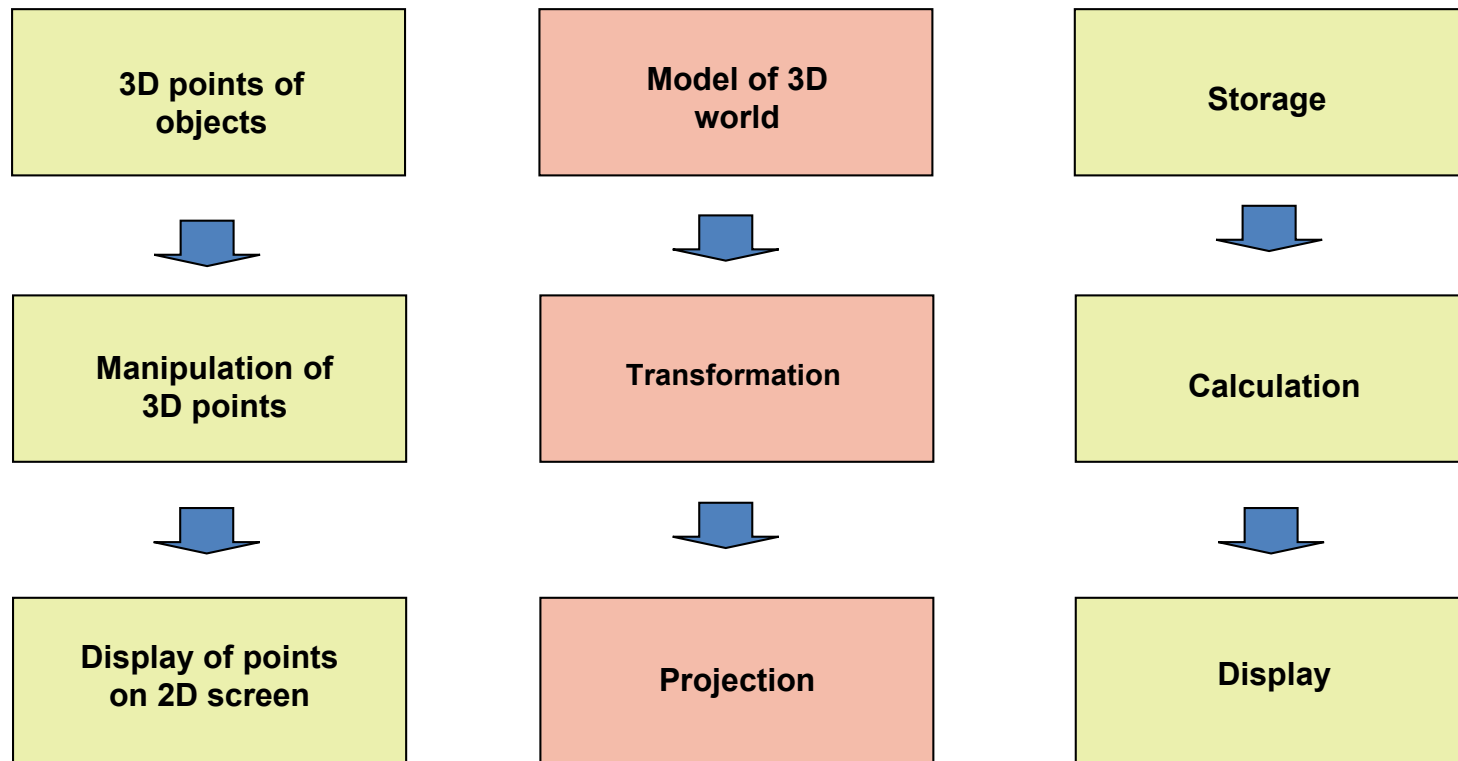

Mathematics for Computer Graphics

Lecture 02
2024-25
Yong Yue and Nan Xiang

Topics for today

➢ Computer representation of objects

➢ Cartesian co-ordinate system

➢ Points, lines and angles

➢ Trigonometry 三角学

➢ Vectors (unit vector) and vector calculations (addition, subtraction, scaling, dot product and cross product)

➢ Matrices (dimension, transpose, square/symmetric/identity and inverse) and matrix calculations (addition, subtraction and multiplication)
Computer representation of objects

Straight line

y

B(6,5)

4

A(3,1)

3

x

Using Pythagoras theorem:

AB = sqrt (4^2 + 3^2) = 5

Gradient of a line

Gradient AB = $\Delta y / \Delta x$ = (4-1) / (8-6) = 3/2
Gradient CD = $\Delta y / \Delta x$ = (3-5) / (6-3) = -(2/3)

An uphill line (direction is 'bottom left to top right') has a **positive** gradient.
A downhill line (direction is 'top left to bottom right') has a **negative** gradient.

Perpendicular lines 垂直线

➢ Given that the gradient of AB=3/2 and gradient of CD=-2/3, when the two gradients are multiplied together we have: (3/2) * (-2/3) = -1. $k_1 \cdot k_2 = -1$

$$\Leftrightarrow l_1 \perp l_2$$

➢ Thus we, conclude that lines AB and CD are perpendicular.

➢ Prove this using graph paper.

➢ What can you say about lines with same gradient?

Angles and trigonometry

三角学

sine (θ) = Opposite / Hypotenuse = BC / AC

cosine (θ) = Adjacent / Hypotenuse = AB / AC
tangent (θ) = Opposite / Adjacent = BC / AB

Angles and trigonometry

A complete revolution gives 360° or 2π (rad).
The following diagram is used to find the values of the trigonometric ratios:

➢ All trigonometric ratios of angles in quadrant 1 have positive ratios.
➢ Only sine of angles in quadrant 2 have positive ratios.
➢ Only tangent of angles in quadrant 3 have positive ratios.
➢ Only cosine of angles in quadrant 4 have positive ratios.

II	I
III	IV

Vectors

➢ **OP** = x**i** + y**j**
where **i** and **j** are **unit vectors** along the x- and y-axes, respectively.

➢ The magnitude or modulus of **OP** = 5**i** + 2**j** is
$|\mathbf{OP}|$ = sqrt($5^2 + 2^2$) = 5.39

➢ Unit vector of OP is
(OP) = **OP** / $|\mathbf{OP}|$ = (5**i** + 2**j**) / 5.39 = 0.93**i** + 0.37**j**

➢ sin(α) = 2 / $|\mathbf{OP}|$ = 2/5.39 = 0.37
cos(α) = 5 / $|\mathbf{OP}|$ = 5/5.39 = 0.93

Vector addition

Vectors added graphically

➢ For two vectors **OP** and **OQ** such as
OP = **V₁** = 5**i** + 2**j** and **OQ** = **V₂** = 2**i** - 4**j**

➢ For two vectors **OP** and **OQ** such as
$\mathbf{OP} = \mathbf{V_1} = 5\mathbf{i} + 2\mathbf{j}$ and $\mathbf{OQ} = \mathbf{V_2} = 2\mathbf{i} - 4\mathbf{j}$

➢ The vector addition is the sum of vectors **OP** and **OQ**
$\mathbf{V_1} + \mathbf{V_2} = (5\mathbf{i} + 2\mathbf{j}) + (2\mathbf{i} - 4\mathbf{j}) = 7\mathbf{i} - 2\mathbf{j}$

➢ The direction of $\mathbf{V_1} + \mathbf{V_2}$ with respect to the x-axis is
$\cos(\alpha) = 7\,/\,|\mathbf{V_1} + \mathbf{V_2}| = 7\,/\,\sqrt{7^2 + (-2)^2} = 0.962$

Vector subtraction
P(2,3)

V_1

V_1-V_2

O

V_2

-V_2

Q(5,-4)

$$\vec{V_1} - \vec{V_2} = (2,3) - (5,-4)$$
$$= (-3,7)$$

Vectors subtracted graphically

➤ For two vectors **OP** and **OQ** such as
OP = V_1 = 2**i** + 3**j** and **OQ** = V_2 = 5**i** - 4**j**

➤ V_1 – V_2 = (2**i** + 3**j**) - (5**i** - 4**j**) = -3**i** + 7**j**

➤ The direction of V_1 - V_2 with respect to the x-axis is
$\cos(\alpha)$ = -3 / |V_1 + V_2| = -3 / sqrt((-3)^2 + 7^2) = -0.394

Vector subtraction

Vectors subtracted graphically

Vector scaling 矢量缩放

A vector may be scaled up or down by multiplying it with a scalar number. Assume the following vector

$$\mathbf{V} = 4\mathbf{i} + 3\mathbf{j}$$
multiplying by 3, we have

$$3*\mathbf{V} = 3*(4\mathbf{i} + 3\mathbf{j}) = 12\mathbf{i}+9\mathbf{j}$$

multiplying by 1/2, we have

$$(1/2)*\mathbf{V} = (1/2)*(4\mathbf{i} + 3\mathbf{j}) = 2\mathbf{i} + 1.5\mathbf{j}$$

Dot product of two vectors

$$\vec{V_1} \cdot \vec{V_2} = |\vec{v_1}||\vec{v_2}| \cos\theta$$

Given vectors **V₁** and **V₂**, their dot product is a scalar.

$\mathbf{V_1} \bullet \mathbf{V_2} = |\mathbf{V_1}||\mathbf{V_2}|\cos(\alpha)$ where $0 \leq \alpha \leq 180^{\circ}$

$\cos(\alpha) = \mathbf{V_1} \bullet \mathbf{V_2} / (|\mathbf{V_1}||\mathbf{V_2}|)$

Dot product of two vectors

➢ The product $\mathbf{V_1} \bullet \mathbf{V_2}$ for $\mathbf{V_1} = x_1\mathbf{i} + y_1\mathbf{j}$ and $\mathbf{V_2} = x_2\mathbf{i} + y_2\mathbf{j}$ is

$$\mathbf{V_1} \bullet \mathbf{V_2} = (x_1\mathbf{i})*(x_2\mathbf{i} + y_2\mathbf{j}) + (y_1\mathbf{j})*(x_2\mathbf{i} + y_2\mathbf{j})$$
$$= (x_1*x_2)*\mathbf{i}*\mathbf{i} + (y_1*y_2)*\mathbf{j}*\mathbf{j} + (x_1*y_2)*\mathbf{i}*\mathbf{j} + (y_1*x_2)*\mathbf{j}*\mathbf{i}$$

➢ Because $\mathbf{i}*\mathbf{i} = \mathbf{j}*\mathbf{j} = 1$ and $\mathbf{i}*\mathbf{j} = \mathbf{j}*\mathbf{i} = 0$, therefore
$$\mathbf{V_1} \bullet \mathbf{V_2} = x_1*x_2 + y_1*y_2$$

➢ The dot product is also expressed as

$$\mathbf{V_1} \bullet \mathbf{V_2} = |\mathbf{V_1}|\,|\mathbf{V_2}|\cos(\alpha)$$

therefore $\cos(\alpha) = \mathbf{V_1} \bullet \mathbf{V_2} / (|\mathbf{V_1}|\,|\mathbf{V_2}|)$
$$= (x_1*x_2 + y_1*y_2) / (|\mathbf{V_1}|\,|\mathbf{V_2}|)$$

Example use of dot product

Find angle α?

P(3,5)

V_1

Q(2,1)

α

V_2

O

V_1 = 3i + 5j

V_2 = 2i + j

$V_1 \bullet V_2$ = 3*2 + 5*1 = 11

$|V_1|$ = sqrt(3^2 + 5^2) = sqrt(34) = 5.831

$|V_2|$ = sqrt(2^2 + 1) = sqrt(5) = 2.236

$\cos(\alpha)$ = $V_1 \bullet V_2$ / ($|V_1||V_2|$) = 11 / (5.831*2.236) = 0.8437

α = 32.47º

$$\cos \alpha = \frac{V_1 \cdot V_2}{|V_1||V_2|} = \frac{6+5}{\sqrt{34}\sqrt{5}}$$

$$= \frac{11}{\sqrt{170}}$$

Cross product of two vectors

叉积

(i)

$|V_1||V_2|\sin(\alpha)n$

(ii)

For two vectors **V**$_1$ and **V**$_2$ lying on a plane (Figure i), their cross product is another vector, which is perpendicular to the plane (Figure ii).

The cross product is defined as

$$V_1 \times V_2 = |V_1||V_2|\sin(\alpha)n$$

where $0 <= \alpha <= 180$ and **n** is a unit vector along the direction of the plane normal obeying the right-hand rule.

Cross product of two vectors

➤ $V_1 \times V_2 = -V_2 \times V_1$

➤ $V_1 \times V_2 = |V_1||V_2|\sin(\alpha)\mathbf{n}$, thus $|V_1 \times V_2| = |V_1||V_2|\sin(\alpha)$

➤ When $\alpha = 0$, $\sin(\alpha) = 0$. Hence $\mathbf{i}\times\mathbf{i} = \mathbf{j}\times\mathbf{j} = \mathbf{k}\times\mathbf{k} = 0$
where $\mathbf{i}$, $\mathbf{j}$ and $\mathbf{k}$ are unit vectors along the x, y and z axes, respectively.

➤ When $\alpha = 90$, $\sin(\alpha) = 1$. Hence $\mathbf{i}\times\mathbf{j} = \mathbf{k}$, $\mathbf{j}\times\mathbf{k} = \mathbf{i}$ and $\mathbf{k}\times\mathbf{i} = \mathbf{j}$

➤ From the identity above, the reverse is true,
i.e. $\mathbf{j}\times\mathbf{i} = -\mathbf{k}$, $\mathbf{k}\times\mathbf{j} = -\mathbf{i}$ and $\mathbf{i}\times\mathbf{k} = -\mathbf{j}$

Matrices

➢ Matrices are techniques for applying transformations.

➢ A matrix is simply a set of numbers arranged in a rectangular format.

➢ Each number is known as an element.

➢ Capital letters are used to represent matrices, bold letters when printed **M**, or underlined when written M.

➢ A matrix has dimensions that refer to the number of rows and the number of columns it has.

Dimensions of matrices 矩阵的维度

$$A = \begin{bmatrix} \text{Col 1} & \text{Col 2} & \text{Col 3} \\ 1 & 6 & 3 \\ -1 & 2 & 4 \end{bmatrix} \begin{matrix} \text{Row 1} \\ \text{Row 2} \end{matrix}$$

The dimensions of A are (2 × 3)

$$B = \begin{bmatrix} \text{Col 1} & \text{Col 2} & \text{Col 3} \\ 1 & 1 & 2 \\ 3 & 1 & 0 \\ 1 & -4 & 6 \\ 0 & 2 & 1 \end{bmatrix} \begin{matrix} \text{Row 1} \\ \text{Row 2} \\ \text{Row 3} \\ \text{Row 4} \end{matrix}$$

The dimensions of B are (4 × 3)

$$C = \begin{bmatrix} \text{Col 1} & \text{Col 2} \\ 1 & 6 \\ 2 & 9 \\ -3 & -2 \\ 0 & 1 \\ 1 & 0 \end{bmatrix} \begin{matrix} \text{Row 1} \\ \text{Row 2} \\ \text{Row 3} \\ \text{Row 4} \\ \text{Row 5} \end{matrix}$$

The dimensions of C are (5 × 2)

$$D = \begin{bmatrix} \text{Col 1} & \text{Col 2} & \text{Col 3} \\ 1 & 0 & 1 \\ 0 & 1 & 0.5 \\ 0.3 & 0 & 0.2 \end{bmatrix} \begin{matrix} \text{Row 1} \\ \text{Row 2} \\ \text{Row 3} \end{matrix}$$

The dimensions of D are (3 × 3)

Transpose matrix 转置矩阵

➢ When a matrix is rewritten so that its rows and columns are interchanged, then the resulting matrix is called the transpose of the original.

$$A = \begin{bmatrix} 1 & 6 & 3 \\ -1 & 2 & 4 \end{bmatrix}$$

The dimensions of A are (2×3)

$$A^T = \begin{bmatrix} 1 & -1 \\ 6 & 2 \\ 3 & 4 \end{bmatrix}$$

The dimensions of A^T are (3×2)

$$\begin{matrix} 1 & -1 \\ 6 & 2 \\ 3 & 4 \end{matrix}$$

Square and symmetric matrices

nxn 方形矩阵 '

➢ A **square matrix** is a matrix where the number of rows equals the number of columns (e.g. Matrix D in slide 21).

➢ A **symmetric matrix** is a **square matrix** where the rows and columns are such that its transpose is the same as the original matrix, i.e. elements $a_{ij} = a_{ji}$ where $i \neq j$.

$$\begin{bmatrix} 2 & 3 & -1 \\ 3 & 4 & 0 \\ -1 & 0 & 1 \end{bmatrix}$$

Axis of symmetry

$A = A^{T}$ 对你矩阵

Identity matrices 单位矩阵

➢ An **identity matrix, I** is a square and symmetric matrix with zeros everywhere except its diagonal elements which have a value of 1.

➢ Examples of 2x2, 3x3, and 4x4 matrices are

$$I_{(2 \times 2)} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}; \quad I_{(3 \times 3)} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}; \quad I_{(4 \times 4)} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Adding matrices

➢ Matrices **A** and **B** may be added if they have the same dimensions. 相为 m x n

➢ That is, the corresponding elements may be added to yield a resulting matrix.

➢ The sum is **commutative**, i.e. **A** + **B** = **B** + **A**

$$\begin{bmatrix} 2 & 1 & 3 \\ 4 & 1 & -1 \end{bmatrix} + \begin{bmatrix} 3 & 2 & 0 \\ 0 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 5 & 3 & 3 \\ 4 & 2 & -1 \end{bmatrix}$$

5 3 3
4 2 -1

Subtracting matrices

➢ Matrix **B** may be subtracted from matrix **A** if they have the same dimensions, i.e. the corresponding elements of **B** may be subtracted from those of **A** to yield a resulting matrix.

$$\begin{bmatrix} 2 & 1 \\ 6 & 5 \\ 0 & 1 \end{bmatrix} - \begin{bmatrix} 1 & 3 \\ 2 & 2 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & -2 \\ 4 & 3 \\ -1 & 1 \end{bmatrix}$$

➢ The result is **not commutative**. Reversing the order of the matrices yields different results, i.e. **A - B ≠ B -A**

$$\begin{bmatrix} 6 & 2 \\ 1 & 0 \end{bmatrix} - \begin{bmatrix} 1 & 3 \\ -1 & 1 \end{bmatrix} = \begin{bmatrix} 5 & -1 \\ 2 & -1 \end{bmatrix}$$

Reversing the operation
$$\begin{bmatrix} 1 & 3 \\ -1 & 1 \end{bmatrix} - \begin{bmatrix} 6 & 2 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} -5 & 1 \\ -2 & 1 \end{bmatrix}$$
Different result

Multiplying matrices

➢ By a constant

$$3 \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 6 \\ 6 & 3 \end{bmatrix}$$

$$-1 \begin{bmatrix} 1 & 0 & 1 \\ 2 & 1 & 2 \end{bmatrix} = \begin{bmatrix} -1 & 0 & -1 \\ -2 & -1 & -2 \end{bmatrix}$$

➢ By a matrix - The rule for multiplying one matrix to another is simple: if the **number of columns** in the first matrix is the **same as the number of rows** in the second matrix, the multiplication can be done.

(3×2) and (2×4)

Yes; because these are equal

The dimensions of the resulting matrix are (3×4)

So $M_1(r_1*c_1) * M_2(r_2*c_2)$

  $= M_3(r_1*c_2)$ where $c_1 = r_2$

Multiplying matrices

Dimension 2×4

Dimension 4×3

Dimension 2×3

$$\begin{bmatrix} 2 & 6 & 1 & 0 \\ 3 & 2 & 4 & 2 \end{bmatrix} \times \begin{bmatrix} 1 & 1 & 2 \\ 0 & 3 & 5 \\ 2 & 4 & 1 \\ 1 & 0 & 3 \end{bmatrix} = \begin{bmatrix} \triangle\!* & \hexagon\!* & * \\ * & * & \bigcirc\!* \end{bmatrix}$$

$$2 \quad 6 \quad 1 \quad 0 \quad \times$$

→ 1
→ 0
→ 2
→ 1

gives $(2 \times 1) + (6 \times 0)$
$+ \ (1 \times 2) + (0 \times 1)$
$= \ 2 + 0 + 2 + 0$
$= \ \triangle{4}$

$$2 \quad 6 \quad 1 \quad 0 \quad \times$$

→ 1
→ 3
→ 4

gives $(2 \times 1) + (6 \times 3)$
$+ \ (1 \times 4) + (0 \times 0)$
$= \ 2 + 18 + 4 + 0$
$= \ \hexagon{24}$

Multiplying matrices – example

$$3 \quad 2 \quad 4 \quad 2 \qquad \times$$

$$\to 2$$
$$\to 5$$
$$\to 1$$
$$\to 3$$

gives $(3 \times 2) + (2 \times 5)$
$+ \quad (4 \times 1) + (2 \times 3)$
$= \quad 6 + 10 + 4 + 6$
$= \quad \boxed{26}$

$$
\begin{bmatrix} 2 & 6 & 1 & 0 \\ 3 & 2 & 4 & 2 \end{bmatrix}
\times
\begin{bmatrix} 1 & 1 & 2 \\ 0 & 3 & 5 \\ 2 & 4 & 1 \\ 1 & 0 & 3 \end{bmatrix}
=
\begin{bmatrix} 4 & 24 & 35 \\ 13 & 25 & 26 \end{bmatrix}
$$

The overall result

Non-commutative property of matrix multiplication

$$AB \neq BA$$

Matrix multiplication is not **commutative.**

$$\begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} \times \begin{bmatrix} 1 & 4 \\ 2 & 6 \end{bmatrix} = \begin{bmatrix} 4 & 14 \\ 7 & 24 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 4 \\ 2 & 6 \end{bmatrix} \times \begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} = \begin{bmatrix} 14 & 9 \\ 22 & 14 \end{bmatrix}$$

Reversing the order of the matrices yields different results.

Non-commutative property
of matrix multiplication

Reversing the order of the matrices yields different results (e.g. Slide 30) or the condition for matrix multiplication will not be satisfied (e.g. Slide 28).

Further example:

$$\mathbf{A} = [1 \ 2 \ 3], \qquad \mathbf{B} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

Will the following multiplications be possible?

A*B $= [14]$

B*A $= \begin{pmatrix} 1 & 2 & 3 \\ 2 & 4 & 6 \\ 3 & 6 & 9 \end{pmatrix}$

Inverse matrices 逆矩阵

If two matrices **A** and **B**, when multiplied together, results in an identity matrix **I**, then matrix **A** is the inverse of matrix **B** and vice versa, i.e.

$$\mathbf{A} \times \mathbf{B} = \mathbf{B} \times \mathbf{A} = \mathbf{I}$$

$$\mathbf{A} = \mathbf{B}^{-1} \text{ and } \mathbf{B} = \mathbf{A}^{-1}$$

卡西欧计算器 OPTN → x^{-1}

e.g.

$$\begin{bmatrix} 7 & 3 \\ 2 & 1 \end{bmatrix} \times \begin{bmatrix} 1 & -3 \\ -2 & 7 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Therefore

$$A^{-1} = \begin{bmatrix} 1 & -3 \\ -2 & 7 \end{bmatrix}$$

Topics covered today

➢ Computer representation of objects

➢ Cartesian co-ordinate system

➢ Points, lines and angles

➢ Trigonometry

➢ Vectors (unit vector) and vector calculations (addition, subtraction, scaling, dot product and cross product)

➢ Matrices (dimension, transpose, square/symmetric/identity and inverse) and matrix calculations (addition, subtraction and multiplication)
